CASE STUDY

Keeping a coach fleet shining

MARKET	COUNTRY	SYSTEM TYPE
Vehicle Wash	UK	Reverse Osmosis

Application

We were recently contacted by a coach hire company, who above all else pride themselves on the appearance of their modern fleet. Being located in a hard water area has always presented challenges when it came to keeping their paintwork and windows clean, resulting in continuous manual rinsing and drying by hand.

The issue, particularly at this time of year has been amplified by the presence of high levels of road salt being used up and down the country, resulting in the familiar "white film" being left behind on the vehicle's bodywork and glass.

Solution

The addition of the Kirton system has completely removed this concern by providing an automated ultra-pure final rinse cycle which dries naturally on the vehicle without leaving any residual water marks or streaks.

If you have an issue with poor quality final rinse water, contact us to arrange a free survey, then discover and explore what savings are possible for your business.
